

Closing the Gap in Email Security

InboxGuard by Ironvest

InboxGuard is an AI-based cloud email security solution that protects the modern workforce from modern and complex attacks such as business email compromise, credential phishing, account takeover, ransomware and more.

InboxGuard fuses human intelligence with advanced AI and Machine Learning to detect and stop targeted phishing emails that evade Secure Email Gateways. Unlike other email security solutions, InboxGuard performs advanced checks on every email and unobtrusively warns users to look out for suspicious elements.

InboxGuard works in tandem with Secure Email Gateway (SEG) solutions, by adding a supplementary layer, which provides demonstrable, instant, and ongoing value. Deploy in minutes with no downtime or disruption to users' emails or workflows. InboxGuard is an official add-in to O365, Exchange, or Google environments meaning the setup experience is seamless, for both admins and users.

Key Features & Benefits:

- Warns users of suspicious email elements with an industry leading 99.99% success rate
- No quarantine or blocking of emails, no ongoing maintenance
- Encourages employees to secure their inbox by reviewing flagged messages before clicking
- Ongoing staff training, improving the security of the 'human firewall'
- Automated scaling and billing
- Requires no MX record or settings changes
- Simple integration with O365, Exchange, or Google
- Deployed to all users within an organisation with 1-click, or choose to apply by groups or individual users
- Offers a dashboard to administrators to manage entire email ecosystem
- Reporting dashboard to understand 'email health' of clients

Why InboxGuard?

- Advanced and sophisticated email cyber threats are bypassing standard Secure Email Gateway services and infiltrating mail servers. Email is the most exposed inroad for cyber-attacks, so a complementary service is required to ensure you are offering your clients complete protection
- InboxGuard incorporates a combination of advanced threat protection, user education and awareness
- Easy to setup and administer meaning no downtime or loss of productivity
- Reporting dashboard means you can understand email health of your clients at a granular level
- Personalised interface with customisable functionalities ensures InboxGuard works to your preference
- Centralised management dashboard
- InboxGuard reported over 98% reduction in clicks on phishing emails

How does InboxGuard check an email?

InboxGuard's main focus is AI and machine learning – use of proprietary algorithms means that InboxGuard is always becoming more intelligent. InboxGuard begins their advanced checks with inputs from the thousands of data points available from every email -

- The path the email took
- Which servers it passed through
- If the email is expected behaviour
- Who the sender is
- Where they're sending from
- What time the email was sent from
- If any camouflage techniques are present
- If there's suspicious language used
- If the sender appears on any known phishing blacklists
- The sender's domain age and reputation
- Any policies/certifications around SPF/DKIM/DMARC
